

Coding with Scratch

scratch.mit.edu

Definitions:

Scratch: a visual programming language developed by MIT Technology Lab to make programming easier and more fun to learn.

Sprite: a character (such as a cat) that understands and obeys the commands given to them.

Scripts: stacks of blocks you connect together to create commands

Script execution: when your script runs

Scratch Programming Environment

A screenshot of the Scratch programming environment. The interface includes a menu bar at the top with 'File', 'Edit', 'Tips', and 'About'. Below the menu bar is a toolbar with icons for cursor tools. The main stage area shows a cat sprite on a white background. The right side features a 'Scripts Area' with a 'Blocks Palette' containing various block categories and specific blocks like 'move 10 steps', 'turn 15 degrees', 'point in direction 90', 'point towards', 'go to x: 0 y: 0', 'go to mouse-pointer', 'glide 1 secs to x: 0 y: 0', 'change x by 10', 'set x to 0', 'change y by 10', 'set y to 0', 'if on edge, bounce', and 'set rotation style left-right'. The bottom left shows the 'Sprite List' with 'Sprite1' selected. Labels with arrows point to the 'Menu Bar', 'Cursor Tools', 'Tabs', 'Stage', 'Scripts Area', and 'Sprite List'.

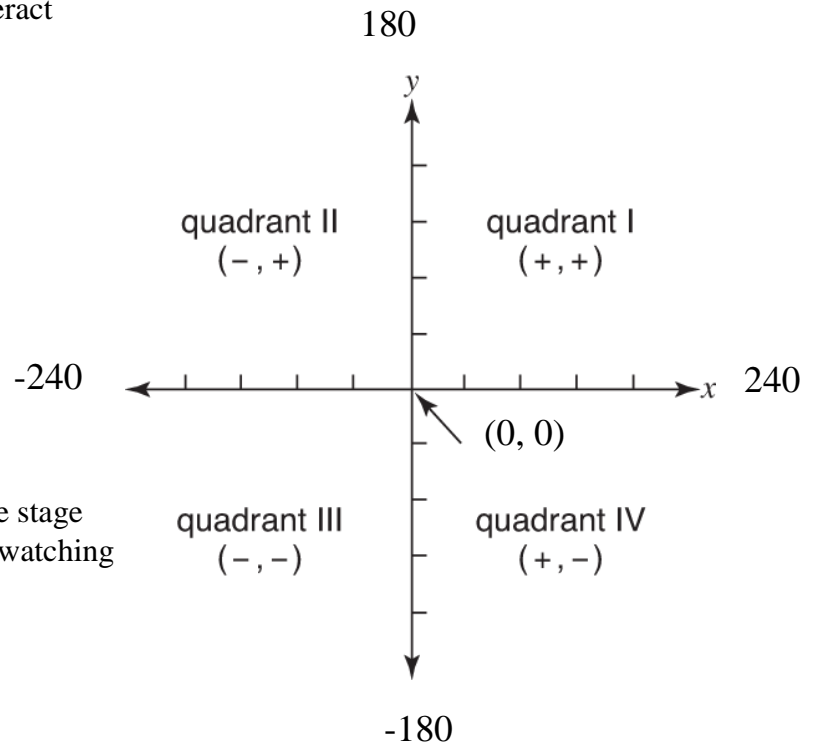

The Stage

Stage: where your sprites move, draw and interact

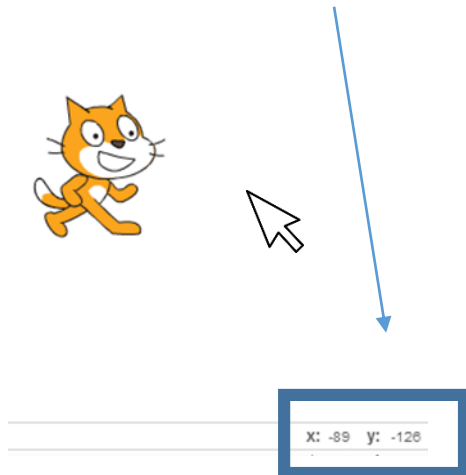

The stage is 480 steps wide and 360 steps tall.

X is horizontal

Y is vertical

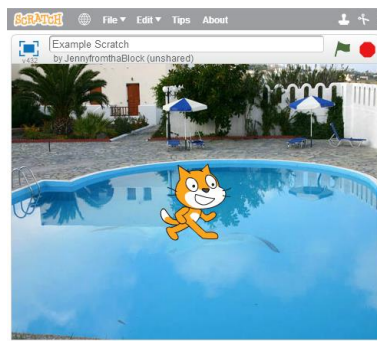

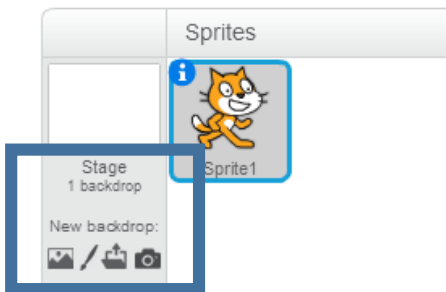

You can find the coordinates of any area of the stage by moving the mouse cursor to that point and watching the numbers in the Mouse (x, y) display area.

Backdrops Tab

You can change the background of the stage by opening a new backdrop.

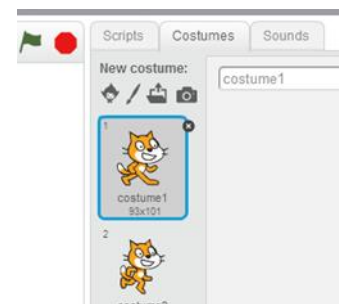

Sprite List

Each sprite on the list has own scripts, costumes and sounds.

Costumes Tab

You can change the appearance of sprites with “costumes.”

Sounds Tab

Sprites can play a wide variety of sounds. There are preexisting ones within Scratch or you can record sounds (if your computer has a microphone) or import existing sound files from your computer. Scratch can only read MP3 and WAV sound files.

Blocks Tab

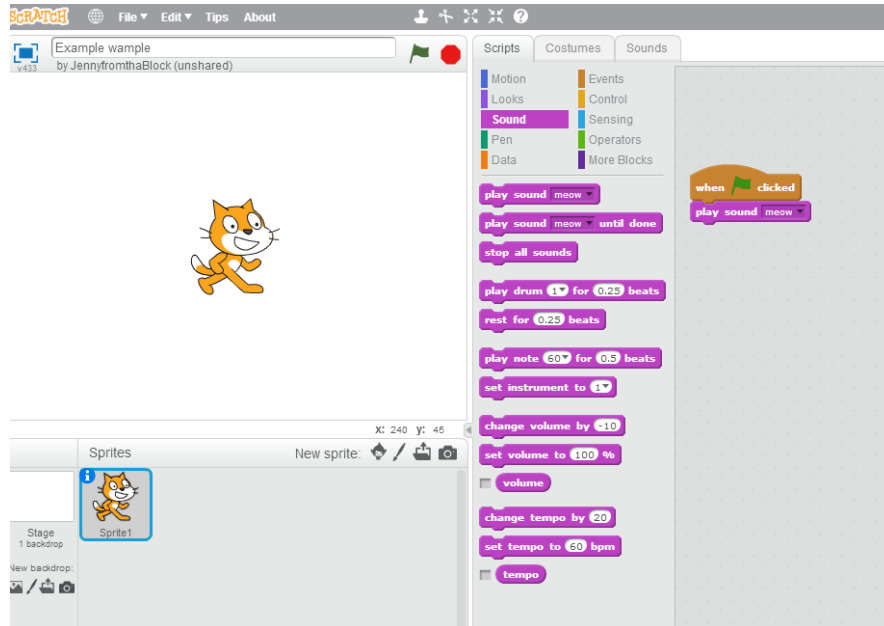

There are 10 categories of code blocks in the Block Palette:

- **Motion:** controls sprite placement, direction, rotation and movement
- **Looks:** affect sprite and backdrop appearance and can display text
- **Sound:** control playback and volume of audio
- **Pen:** use to draw with different colors and pen styles
- **Data:** store data to be used by applications when they execute
- **Events:** trigger script execution
- **Control:** execute programming logic using loops or conditional logic
- **Sensing:** can determine location of mouse and sprites, whether touching something, etc.
- **Operators:** perform logical comparisons
- **More Blocks:** custom code blocks programmers can create

Scripts Area

This is the area where you can program the sprites to do things and for the background to change by dragging and dropping blocks and snapping them together.

Types of Scratch Blocks

- **Stack blocks:** a notch in the top and a bump at the bottom
 - Can be attached to the underside of blocks and other blocks can be attached to it
- **Hat blocks:** a rounded or curved top and bump on the bottom
 - Can create an event-driven script
- **Reporter blocks:** rounded sides 
- **Boolean blocks:** angled sides 
- **C blocks:** shaped like and named for the letter C
 - Control blocks used to create a loop, grouped around other blocks
- **Cap blocks:** notch on top and flat bottom 
 - signifies the end of a script—can only attach to other blocks
